Dear FCC Board:

I have recently become aware that the FCC has temporarily approved an application for a company called “Light Squared” to operate an internet service close to the GPS band width. It is my understanding that this has been proven to cause issues that would render GPS useless. Am sure that you understand how important GPS is to our country. It is used by our military, governmental bodies, municipalities, businesses as well as by civilians. GPS has saved several lives of individuals that call 911 and are unable to provide a location and they are tracked by GPS from their cell phone or automobile. Why would you risk that wonderful service?

I want to share how myself and my customers utilize GPS everyday in our farming operations. I sell technologies that utilize GPS for automated machine control for farmers. We can steer a tractor to 1” level accuracy. We can shut off the application of herbicides, fertilizers and seed down to the 1 ft. level to reduce overlap and skips. My customers have invested millions of dollars in this technology through my small dealership alone. Allowing this to go through is threatening not only my livelihood but theirs as well. This application **SHOULD NOT** and **CAN NOT BE ALLOWED** to go through as it will put our whole country at risk just for the sake of internet that is available with other services virtually anywhere in the US with satellite internet.

This proposal is **BAD NEWS** and is designed to line the pockets of “Light Squared” and needs to be **STOPPED NOW**.

Sincerely,

Tim Norris – CEO
